

## **Individual Status Report #5: Raheem Hampton**

For next week we will be defining the acceptance criteria for user stories in our application for testing. This will be done via the natural language Gherkin format. We will define features, scenarios, and formalized examples of how features work. We will create and update a test file for the test features and cases. Basic functionality for the website will also continue to be implemented as well as working on presentation ideas for the project.

This week we made Gherkin model tests to outline and define what our user stories should accomplish. We updated the test to include the base features and a couple of additional features for good measure.

The plan for next week is to work on implementing additional features for our application. We also plan to finish implementing the logic for the base features and update the CSS design. My part is developing the profile and edit-profile page. The plan is to implement a photo, hosted events table, and going to event table. For the edit-profile page, I am going to implement a validation form the accepts blank fields without wiping database entries and updating non-blank entry fields in the database.
