

Individual Status Report #6: Raheem Hampton

The plan for next week is to work on implementing additional features for our application. We also plan to finish implementing the logic for the base features and update the CSS design. My part is developing the profile and edit-profile page. The plan is to implement a photo, hosted events table, and going to event table. For the edit-profile page, I am going to implement a validation form that accepts blank fields without wiping database entries and updating non-blank entry fields in the database.

This week I accomplished everything stated above. As a recap, I implemented the profile page and added an image with profile name, implemented both tables with links and a scroll bar with the use of div's, made a custom button to navigate to edit profile page. Made the edit-profile page and added fields for changing: first name, last name, email, password, and profile image.

For next week, we plan to finish adding our additional features and clean up the websites of any inconsistent design and logical processes. After, we will start working on the presentation as a group and decide how we will pitch the product. Most likely it will be recorded through zoom and the application along with all of its features will be showcased.
