# Project Milestone 1: Product Backlog and User Stories

The goal for the first week was to list the required features and four extra features that we will be implementing in our application. To do this we will create user stories related to our application to map out how it will be used, after deciding on the additional features. From there, a to-do list will be created separating responsibilities, and will be assigned to each team member. The assessment of leadership for the project will also be re-evaluated for the next week.

Product Backlog:

This week, we completed the project backlog created from the previous week, shown above. We then assigned each group member with a user story. This week we didn't have any issues completing the tasks and finished them with each member contributing. We learned that we work well together when we hold meetings and discuss what we will be doing rather than communicating through other means.

For the upcoming week the tasks will be broken down as follows below:

Assigned features:
1. Milan Thakkar - Create profile

2. Mizing Paloian III - Sign into account
3. Mohammad Husein - Listing Events
4. German Cruz - Viewing Events
5. Ben Heidinger - Fill in information about created event.
6. Alex Graca - Remove an event that was cancelled.
7. Raheem Hampton - Homepage

Four (we have six) extra features:
- Add birthdays field to events.
- Attach picture to event.
- Customize UI.
- Search for an event
- Holidays
- User accounts liked events.

Next week, with the stories broken down by team members, we will meet and discuss which tool we will be using to create the wireframes and low fidelity mockups. We will then create the mockups and use them to develop a storyboard. We'll be updating the product backlog to reflect what we've done and including a screenshot in our document. The instructional team will meet two times during the week to complete and assess where we are on the project, information about the scheduled dates and time will be put out to the team on discord.
